

Data Cleaning:

- Missing values were checked and handled appropriately.

Data Preprocessing:

- Categorical variables were encoded using Label Encoding.

Feature scaling was applied where required.

Handling Imbalance:

- SMOTE technique was used to balance the target variable.

Exploratory Data Analysis:

- Correlation heatmap was generated.

Department-wise performance distribution was analysed.

Model Building:

- Random Forest Classifier was used to build prediction model.

Feature Importance:

- Important features affecting employee performance were identified using feature importance.
